(a)

Figure 18 $d(I) \cdot L^2 / (dI)^2$ as a function of frequency (blue noise pattern). In this figure, for each curve, four points are selected:

Figure 19. The predicted $d(L'-L_e')/dL'$ as a function of frequency. Blue noise pattern. The 16 cpd is obtained by interpolation, and the 24 cpd is obtained by extrapolation.

Conclusions

In this study, psychophysical experiments were described investigating lightness difference perception for spatially modulated patterns using a lightness differ-

produced halftone patterns where the pattern visibility is significantly more uniform than when the levels are equally spaced in L^* . ▲
